DAMIETTA UNIVERSITY

CHEM-103:

BASIC ORGANIC CHEMISTRY

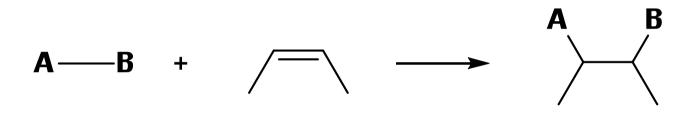

LECTURE 4

Dr Ali El-Agamey

Types of reactions

1-Addition reaction

They normally involves **unsaturated compounds** capable of accepting additional atoms.

2- Substitution reaction

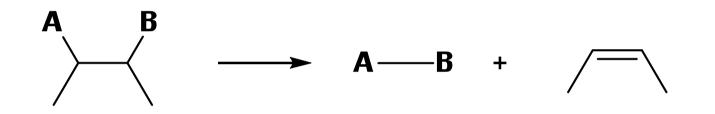

Atom or group **replaces** atom or group.

$$A: + B - C \longrightarrow A^{\oplus} - B + C^{\ominus}$$

Types of reactions

3- Elimination reaction

Atoms are **removed** to produce unsaturated compounds or ring.

Bond-Dissociation Enthalpies (BDE)

- Bond-dissociation enthalpies (BDE, also called Bond-dissociation energy) is the amount of enthalpy required to break a particular bond homolytically.
- Bond-dissociation **requires** energy (+BDE).
- Bond formation **releases** energy (-BDE).
- BDE can be used to estimate ΔH for a reaction.
 - *Homolytic cleavage*: When the bond breaks, each atom gets one electron.
 - *Heterolytic cleavage*: When the bond breaks, the most electronegative atom gets both electrons.

Homolytic and Heterolytic Cleavages

Homolytic cleavage (free radicals result)

$$A:B \longrightarrow A \cdot +$$

 $\Delta H^{\circ} =$ bond-dissociation enthalpy

$$\ddot{Cl}:\ddot{Cl}: \longrightarrow 2:\ddot{Cl}\cdot \Delta H^\circ = 242 \text{ kJ/mol} (58 \text{ kcal/mol})$$

۰B

Heterolytic cleavage (ions result)

:

$$A:B \longrightarrow A^{+} + \overline{:B}$$

$$(CH_{3})_{3}C \xrightarrow{\overbrace{C}} : \longrightarrow (CH_{3})_{3}C^{+} + : \overset{\cdot}{C}_{1}:^{-} (\Delta H^{\circ} \text{ varies with solvent})$$

Bond Dissociation Energies for the Formation of Free Radicals

Formation of a methyl radical *Bond-dissociation enthalpy* $CH_4 \longrightarrow H \cdot + \cdot CH_3$ $\Delta H^\circ = 435 \text{ kJ} (104 \text{ kcal})$ Formation of a primary (1°) radical $CH_3 - CH_2 - CH_3 \longrightarrow H^{\circ} + CH_3 - CH_2 - \dot{C}H_2 \Delta H^{\circ} = 410 \text{ kJ} (98 \text{ kcal})$ Formation of a secondary (2°) radical $CH_3 - CH_2 - CH_3 \longrightarrow H + CH_3 - CH_3 - CH_3 = 397 \text{ kJ} (95 \text{ kcal})$ Formation of a tertiary (3°) radical $\begin{array}{ccccc} CH_{3} & & CH_{3} \\ | & \\ CH_{3} - \begin{array}{c} C - H \\ | \\ CH_{2} \end{array} & H \cdot + \begin{array}{c} CH_{3} - \begin{array}{c} C + \\ CH_{3} \end{array} \\ CH_{3} \end{array}$ CH_3 $\Delta H^{\circ} = 381 \text{ kJ (91 kcal)}$

Stability of Free Radicals

 Free radicals are more stable if they are highly substituted.

Free Radicals

- Copyright © 2010 Pearson Prentice Hall, Inc.
- Also electron-deficient.
- Stabilized by alkyl substituents.
- Order of stability:
 3° > 2° > 1° > methyl

Lewis Structures of Free Radicals

:Ċl·	÷Ër•	H:Ö·	H H:Ċ· H	Н Н H:Ċ:Ċ· Н Н	
Written					
Cl·	Br·	НΟ·	CH ₃ ⋅	CH ₃ CH ₂ ⋅	
chlorine atom	bromine atom	hydroxyl radical	methyl radical	ethyl radical	
Copyright © 2010 Pearson Prentice Hall, Inc.					

• Free radicals have unpaired electrons.

I pwis structures

 Halogens have 7 valence electrons so one of them will be unpaired (radical). We refer to the halides as atoms not radicals. *Organic Chemistry*, 7th Edition L. G. Wade, Jr.

Hydrocarbons

Hydrocarbons are molecules that are made of **carbon and hydrogen ONLY**.

TABLE 3-1

Hydrocarbon Classifications

Compound Type	Functional Group	Example	
alkanes	none (no double or triple bonds)	$CH_3 - CH_2 - CH_3$, propane	
alkenes	>C=C < double bond	$CH_2 = CH - CH_3$, propene	
alkynes	$-C \equiv C - triple bond$	$H-C \equiv C-CH_3$, propyne	
aromatics	benzene ring $C C C$	CH ₂ CH ₃ ethylbenzene	

Copyright © 2010 Pearson Prentice Hall, Inc.

Alkanes

- General formula: C_nH_{2n+2}
- Found in everything from natural gas to petroleum.
- The smaller alkanes have very low boiling points (b.p.) therefore they are gases.

• 1- Hydrogenation of alkenes

C_nH_{2n}	$H_2 + Pt, Pd, or Ni$	C_nH_{2n+2}
Alkene		Alkane

• 2- Alkyl halides

(a) Via hydrolysis of Grignard reagent

(b) Reduction by metal and acid

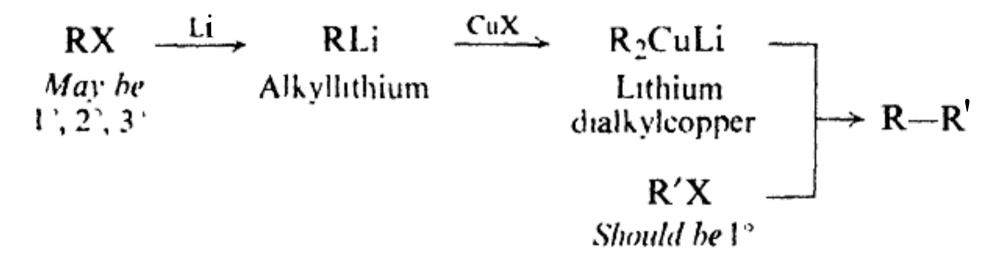

(c) Coupling with organo-copper compounds.

• (a) Hydrolysis of Grignard reagent

• (b) Reduction by metal and acid

 $\begin{array}{cccc} RX + Zn + H^{+} & \longrightarrow & RH + Zn^{++} + X^{-} \\ CH_{3}CH_{2}CHCH_{3} & \xrightarrow{Zn, H^{+}} & CH_{3}CH_{2}CHCH_{3} \\ & & & & & \\ Br & & & H \\ sec-Butyl bromide & & n-Butane \end{array}$

• (c) Coupling with organo-copper compounds.

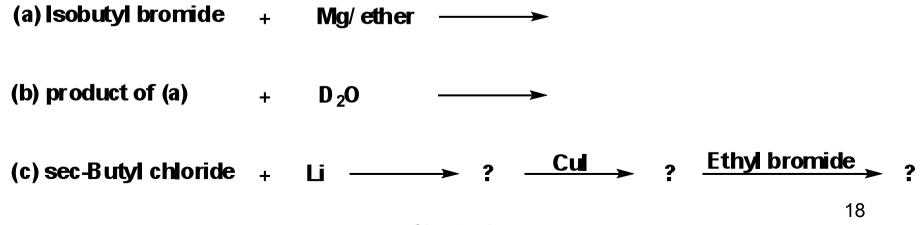

• (c) Coupling with organo-copper compounds.

$$\begin{array}{cccc} CH_{3}CH_{2}Cl & \xrightarrow{Li} & CH_{3}CH_{2}Li & \xrightarrow{Cul} & (CH_{3}CH_{2})_{2}CuLi & \\ & & \\ Ethyl & & \\ chloride & & \\ & & \\ chloride & & \\ &$$

Homework

(1) Show how can you prepare n-butane from:¹
(a) n-butyl bromide
(b) sec-butyl bromide and
(c) 2-butene.

Complete the following equations:¹

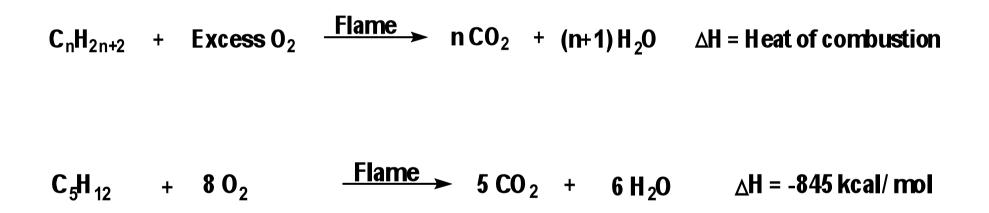

Reactions of Alkanes

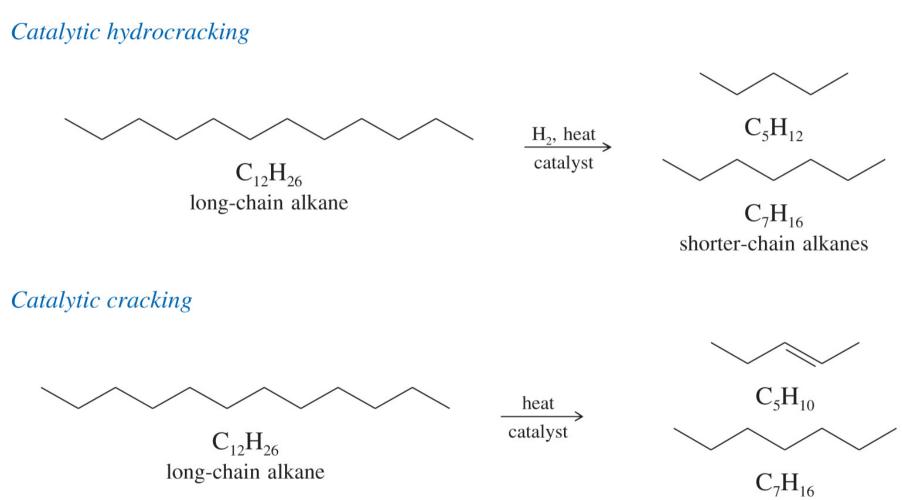

- 1- Combustion
- 2- Cracking (Pyrolysis)
- 3- Halogenation
 - General reaction; examples
 - General mechanism; mechanism of specific example (CH₄; propane)
 - Calculation of relative reactivities; Product ratios

Reactions of Alkanes

1- Combustion

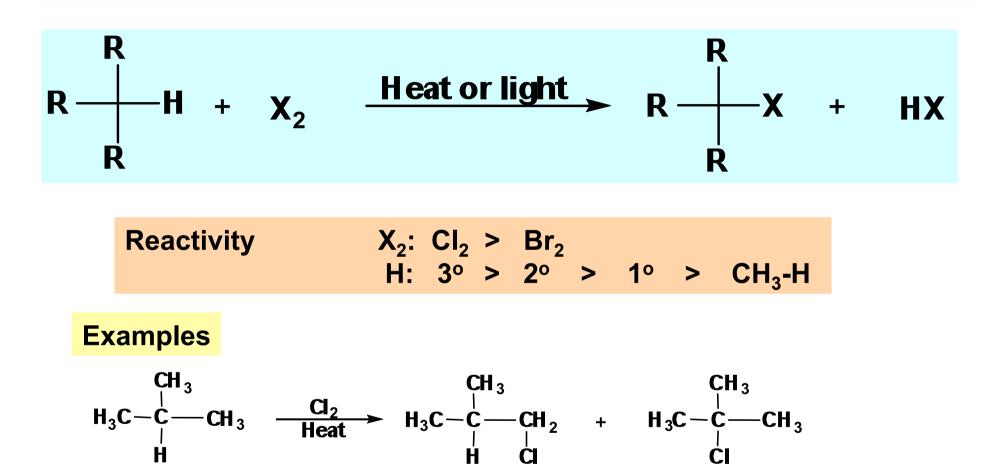

2-Cracking (Pyrolysis)

shorter-chain alkanes and alkenes

Copyright © 2010 Pearson Prentice Hall, Inc.

(3) Halogenation

$$\begin{array}{ccccccc} CH_3-CH_2-CH_3 & \xrightarrow{CI_2} & CH_3-CH_2-CH_2 & + & CH_3-CH-CH_3 \\ & & & & & & & \\ & & & & & & & \\ & & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & \\ & & & & \\ & & & \\ & & & & \\ & & & & \\ & & & & \\ &$$

Homework

- **4.40** Among the isomeric alkanes of molecular formula C_5H_{12} , identify the one that on photochemical chlorination yields
 - (a) A single monochloride
 - (b) Four isomeric monochlorides
 - (c) Three isomeric monochlorides
 - (d) Two isomeric dichlorides
